

Question:

Drug of choice for absence seizures: March 2011
Answer Choices: A. Carbamazepine B. Lamotrigine C. Valproate D. Phenytoin

Reasoning + Answer:

<think> Absence seizures, also known as petit mal seizures, are characterized by a brief loss of consciousness and staring episodes. They are typically managed with anti-epileptic drugs that have a high efficacy in controlling these specific seizures. Valproate is known to be effective for absence seizures as well as other types of epilepsy. Carbamazepine and lamotrigine are more commonly used for trigeminal seizures and generalized tonic-clonic seizures respectively. Phenytoin is used for trigeminal seizures and maintenance of status epilepticus. </think> <answer> C. Valproate </answer>
