

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

`<think>`
15 cups in the morning for 20 chickens is $15 / 20 = 0.75$ cups per chicken
25 cups in the afternoon for 20 chickens is $25 / 20 = 1.25$ cups per chicken
So, for 20 chickens, the total amount of feed given so far is $0.75 + 1.25 = 2$ cups per chicken
If each chicken gets 3 cups of feed, the total amount of feed needed for 20 chickens is $3 * 20 = 60$ cups
So far, 2 cups have been given to the chickens, leaving $60 - 2 = 58$ cups to be given in the final meal
`</think>`
`<answer>`
58
