

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
Cost of one glass = \$5
Cost of second glass = 60% of \$5 = 0.6 * 5 = \$3
Total cost for 16 glasses = (Cost of one glass) * (Number of glasses - 1) + (Cost of second glass) * (Number of glasses)
= (5 * 15) + (3 * 1)
= 75 + 3
= \$78
</think><answer>78</answer>
