

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
He needs to buy 16 glasses
One glass costs \$ 5 , so 16 glasses would cost $16 * 5 = 80$
But every second glass costs 60 % of the price , so he only pays for 8 glasses at full price and 8 glasses at 60 % of the price
8 glasses at full price will cost $8 * 5 = 40$
8 glasses at 60 % of the price will cost $8 * 5 * 0.6 = 24$
The total cost will be $40 + 24 = 64$
</think>
<answer> 64 </answer>
