

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

To determine the total number of meters James runs in a week, we need to calculate the total number of meters he runs in a single sprint and then multiply it by the number of sprints he runs per week.

James runs 3 sprints 3 times a week, so he runs a total of $3 \times 3 = 9$ sprints per week. Since each sprint is 60 meters, we multiply 9 sprints by 60 meters to get the total number of meters. $9 \times 60 = 540$ meters.

</think><answer>540</answer>
