

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To determine the total number of cups of feed Wendi needs to give her chickens in the final meal of the day, we first need to calculate the total number of cups of feed she has already given.
In the morning, she gave her chickens 15 cups of feed, and in the afternoon, she gave them another 25 cups of feed.
So, the total number of cups of feed she has already given is $15 + 25 = 40$ cups.
Since Wendi has 20 chickens, and each chicken gets 3 cups of feed per day, the total number of cups of feed she needs per day is $20 * 3 = 60$ cups.
To find out how many cups of feed she needs to give in the final meal of the day, we subtract the total cups of feed she has already given from the total cups of feed she needs per day: $60 - 40 = 20$ cups.
</think><answer>20</answer>
