

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , let's break this down . Kylar wants to buy 16 glasses . One glass costs \$ 5 , but every second glass costs 60 % of the price , which is \$ 3 . So , for every 2 glasses , Kylar will pay \$ 5 + \$ 3 = \$ 8 . To find the total cost , we need to find how many pairs of glasses Kylar is buying . Since he's buying 16 glasses , we can divide 16 by 2 to get 8 pairs . Now , we multiply the number of pairs by the cost of each pair , which is \$ 8 . So , the total cost will be $8 * \$8 = \64 .</think><answer> 64 </answer>
