

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

To find the profit Josh made, we first need to calculate the new value of the house after the repairs. The original price of the house was \$80,000, and Josh put in \$50,000 in repairs. So, the new value of the house is $\$80,000 + \$50,000 = \$130,000$.

The original value of the house was 100% of its original value, but the repairs increased the value by 150%. To find the original value, we can set up the equation: $\$130,000 = \$80,000 + (150\% \text{ of } \$80,000)$.

Simplifying the equation, we get $\$130,000 = \$80,000 + 0.5(\$80,000)$.

Solving for x, we get $\$130,000 = \$120,000$.

Now that we know the original value, we can calculate the profit made by Josh. Profit = Selling price - Cost price. Here, the selling price is \$130,000 and the cost price is $\$80,000 + \$50,000$. So, the cost price is \$130,000. So, the profit = $\$130,000 - \$130,000 = \$0$.
