

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To find the total amount of feed Wendi gives to her chickens , we need to calculate the total feed given in the morning and afternoon , and then subtract that from the total number of cups of feed she gives in a day . In a day , Wendi gives her chickens 15 cups of feed in the morning and 25 cups of feed in the afternoon . So , the total feed given in the morning and afternoon is $15 + 25 = 40$ cups . Since Wendi feeds each chicken three cups of feed , we need to multiply the total feed given in the morning and afternoon by 3 to find the total number of cups of feed Wendi needs to give her chickens in a day . Therefore , $40 * 3 = 120$ cups . Now , we need to subtract the total feed given in the morning and afternoon from the total number of cups of feed Wendi needs to give her chickens in a day . So , $120 - 40 = 80$ cups .
</think><answer> 80 </answer>
