

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
To find the total cost of the glasses, we need to first calculate the cost of 16 glasses. For the first 15 glasses, the cost will be \$5 each. For the 16th glass, the cost will be 60% of \$5, which is \$3. So, the total cost will be $(15 * 5) + 3 = 78$.
</think><answer>78</answer>
