

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
Number of glasses Kylar wants to buy : 16
Price of one glass : 5 dollars
Price of every second glass : $5 * 0.6 = 3$ dollars
Number of glasses that cost 5 dollars : $16 / 2 = 8$
Number of glasses that cost 3 dollars : $16 - 8 = 8$
Total cost of glasses that cost 5 dollars : $8 * 5 = 40$ dollars
Total cost of glasses that cost 3 dollars : $8 * 3 = 24$ dollars
Total cost of all glasses : $40 + 24 = 64$ dollars
</think><answer>
64 </answer>
