

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

To find the profit, we first need to calculate the new value of the house after the repairs. The original value of the house was \$80,000 and the repairs increased its value by 150%. This means the value of the house was multiplied by 2.5 ($1 + 150\% = 2.5$).

So, the new value of the house = original value * 2.5 = $80,000 * 2.5 = 200,000$ dollars.

Now, we need to find the profit. Profit is the difference between the new value of the house and the total amount Josh spent, which is the cost of the house plus the repairs. The total amount spent = $80,000 + 50,000 = 130,000$ dollars.

Now, we can calculate the profit by subtracting the total amount spent from the new value of the house: profit = new value - total amount spent = $200,000 - 130,000 = 70,000$ dollars.

</think><answer> 70000 </answer>
