

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

To find the total number of meters James runs a week , I need to calculate the total meters he runs in one week . Since he runs 3 sprints 3 times a week , I need to first calculate the total meters he runs in one day and then multiply it by 3 to get the total meters he runs in a week .

First , I need to find out how many meters James runs in one day . Since he runs 3 sprints a day and each sprint is 60 meters , I can multiply 3 (number of sprints) by 60 (meters per sprint) to get the total meters he runs in one day . This will be $3 * 60 = 180$ meters per day .

Now , I need to multiply the total meters he runs in one day by 3 to get the total meters he runs in a week . So , I will multiply 180 (meters per day) by 3 (number of days in a week). This will be $180 * 3 = 540$ meters per week .

</think><answer>540 </answer>
