

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

To find the total amount of feed Wendi needs to give her chickens in the final meal of the day , I need to first find the total amount of feed she gives in a day . She gives 15 cups in the morning and 25 cups in the afternoon . So , I will add these two amounts together to get the total amount of feed given in the first two meals .

Total feed in the first two meals = 15 cups + 25 cups = 40 cups .

Since Wendi gives 3 cups of feed to each chicken , and she has 20 chickens , I need to multiply the number of chickens by the amount of feed per chicken to find the total amount of feed needed for the entire flock in a day .

Total feed needed for the flock in a day = 3 cups/chicken * 20 chickens = 60 cups .

Now , I need to subtract the total feed given in the first two meals from the total feed needed for the flock in a day to find the amount of feed needed in the final meal .

Feed needed in the final meal = Total feed needed for the flock in a day - Total feed in the first two meals = 60 cups - 40 cups = 20 cups .

</think>< answer> 20 </answer>
