

Question:
James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
To find the total meters James runs a week, I need to calculate the total meters he runs in one week. I know James runs 3 sprints a day and he runs 60 meters each sprint. So, I need to calculate the total meters he runs in one day by multiplying the number of sprints by the distance of each sprint. Then, I need to multiply the total meters he runs in one day by the number of days he runs in a week.

First, I will calculate the total meters James runs in one day: $3 \text{ sprints} * 60 \text{ meters/sprint} = 180 \text{ meters/day}$.

Next, I will multiply the total meters he runs in one day by the number of days he runs in a week: $180 \text{ meters/day} * 7 \text{ days/week} = 1260 \text{ meters/week}$.

</think><answer>1260</answer>
