

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>To start, the total amount of feed given in the morning and afternoon is $15 + 25 = 40$ cups.

Since there are 20 chickens and they each get 3 cups of feed daily, the total amount of feed the chickens need is $20 * 3 = 60$ cups.

If the total feed for the day is 60 cups and 40 cups have already been given, the remaining amount to be given is $60 - 40 = 20$ cups.</think>

<answer>20</answer>
