

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

`<think>` To start with, James runs 3 sprints a week, and each sprint is 60 meters long.

First, we calculate the total meters he runs in one week for one sprint:

$3 \text{ sprints} * 60 \text{ meters per sprint} = 180 \text{ meters per week}.$

Now, since he runs 3 sprints 3 times a week, we multiply the total meters he runs in one week for one sprint by 3:

$180 \text{ meters per week} * 3 = 540 \text{ meters per week}.$

So, James runs a total of 540 meters a week.`</think>`

`<answer>` 540 meters a week `</answer>`
