

Question:

Eliza's rate per hour for the first 40 hours she works each week is \$10. She also receives an overtime pay of 1.2 times her regular hourly rate. If Eliza worked for 45 hours this week, how much are her earnings for this week?

Reasoning + Answer:

<think>To start with the given information , Eliza's normal rate is \$10 per hour . She worked 45 hours , which means she worked 5 hours overtime .

For the first 40 hours , she earns at her normal rate of \$10 per hour .

So , for 40 hours , her earnings are $40 * \$10 = \400 .

For the overtime hours (5 hours) , she earns 1.2 times her normal rate .

Hence , her overtime rate is $10 * 1.2 = \$12$ per hour .

So , for 5 hours of overtime , her earnings are $5 * \$12 = \60 .

Therefore , her total earnings for the week are $\$400 + \$60 = \$460$.</think>

<answer>\$460 </answer>
