

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
the first glass costs 5 dollars
the second glass costs $0.6 * 5 = 3$ dollars
the third glass costs 5 dollars
the fourth glass costs $0.6 * 5 = 3$ dollars
and so on
therefore , the total cost of the first 8 glasses is $5 + 3 + 5 + 3 + 5 + 3 + 5 + 3 = 32$ dollars
since Kylar wants to buy 16 glasses , and the first 8 glasses cost 32 dollars , the next 8 glasses will cost 32 dollars
therefore , the total cost of 16 glasses is $32 + 32 = 64$ dollars
</think>
<answer>
64 dollars </answer>
