

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

First , calculate the total meters James runs per week for one sprint :

$60 \text{ meters per sprint} * 3 \text{ sprints} = 180 \text{ meters}$

Then , multiply the total meters per week for one sprint by the number of weeks in a week :

$180 \text{ meters per week} * 1 \text{ week} = 180 \text{ meters}$

</think>

<answer>

180 meters

</answer>
