

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
First, Kylar buys 15 glasses at \$5 each and 1 glass at 60% of \$5, which is $0.60 * 5 = \$3$.
So, the cost for 15 glasses at \$5 each is $15 * 5 = \$75$.
The cost for 1 glass at 60% of \$5 is $1 * 3 = \$3$.
Adding the costs together gives $75 + 3 = \$78$.
</think>
<answer>
78</answer>
