

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> To solve this problem , let's break it down into parts . Kylar wants to buy 16 glasses , and we know that the cost of the first glass is \$ 5 . For every second glass , the cost is 60 % of \$ 5 . Therefore , the price of every second glass is $\$ 5 * 0.60 = \$ 3$. Now , let's see how many pairs of glasses there are in 16 glasses . There are 8 pairs of glasses because $(16 / 2 = 8)$. The first glass in each pair costs \$ 5 , and the second glass in each pair costs \$ 3 . So , the total cost for 8 pairs is $(8 \times 5 + 8 \times 3)$. Let's calculate the total cost : $(8 \times 5 = 40)$ and $(8 \times 3 = 24)$. Adding these together gives us $(40 + 24 = 64)$. </think>
<answer> 64 </answer>
