

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> To determine the total meters James runs in a week, we can break the problem into smaller steps. First, calculate the total meters he runs in one sprint, then the total meters he runs in one week. Since James runs 3 sprints a week and each sprint is 60 meters long, we can multiply the number of sprints by the length of each sprint to get the total meters per week. </think>

<think> We can write the calculation as :

$$\text{Total meters per week} = \text{Number of sprints per week} \times \text{Meters per sprint}$$

$$\text{Total meters per week} = 3 \times 60$$

$$\text{Total meters per week} = 180$$

</think>

<answer> 180 </answer>
