

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> To find out how many cups of feed Wendi needs for the final meal , we first calculate the total feed given in the morning and afternoon . We know that Wendi gives 15 cups in the morning and 25 cups in the afternoon , and she has 20 chickens in total . The daily feed for all chickens is the same regardless of the time of day , so the total feed for the day is $15 + 25 = 40$ cups . To find the total feed for one chicken per day , we divide the total daily feed by the number of chickens , which is $40 / 20 = 2$ cups per chicken per day . Since Wendi gives the first two meals (morning and afternoon) to the chickens , the remaining feed to be given in the final meal is the total daily feed minus the feed given in the first two meals , which is $40 - 40 = 0$. </think>
