

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> To determine the total cost of 16 glasses , we need to understand the pricing structure . Each glass costs \$ 5 , and every second glass is sold at 60 % of the regular price . That means every second glass costs $\$ 5 * 0.60 = \$ 3$. We can calculate the total cost by recognizing that in a set of 4 glasses (one at \$ 5 and three at \$ 3 each), the total cost is $\$ 5 + \$ 3 + \$ 3 + \$ 3 = \$ 14$. Kylar wants to buy 16 glasses , which can be divided into 4 sets of 4 glasses . Therefore , the total cost for 16 glasses is $4 * \$ 14 = \$ 56$. </think>

<answer> 56 </answer>
