

Question:

John runs 60 miles a week. He runs 3 days a week. He runs 3 hours the first day and half as much the other two days he runs. How fast does he run?

Reasoning + Answer:

<thinking process >

Step 1 : We know John runs a total of 60 miles per week .

Step 2 : He runs 3 days a week .

Step 3 : On the first day , he runs for 3 hours .

On the other two days , he runs half as much as the first day â so half of 3 hours = 1 . 5 hours per day .

So , total running time per week = 3 hours (first day) + 1 . 5 hours (second day) + 1 . 5 hours (third day) = 3 + 1 . 5 + 1 . 5 = 6 hours per week .

Step 4 : We are told he runs 60 miles in 6 hours .

So , to find his running speed , we divide total distance by total time .

Speed = Total Distance / Total Time = 60 miles / 6 hours = 10 miles per hour .

Step 5 : Confirm the logic â does this make sense ?

Yes , he runs 10 miles per hour on average over the week .

Note : The question asks " How fast does he run ?" â this is asking for average speed , which is total distance divided by total time .

< answer > 10 miles per hour </ answer >
