

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

Let's break down the problem step by step .

1. **Determine the total amount of feed given in the morning and afternoon : **

- In the morning , Wendi gives 15 cups of feed .

- In the afternoon , Wendi gives 25 cups of feed .

- Therefore , the total amount of feed given in the morning and afternoon is :

$$\begin{aligned} & \left[\right. \\ & 15 + 25 = 40 \text{ { cups } } \\ & \left. \right] \end{aligned}$$

2. **Calculate the total amount of feed each chicken needs in a day : **

- Each chicken needs 3 cups of feed per day .

- Therefore , for 20 chickens , the total amount of feed needed in a day is :

$$\begin{aligned} & \left[\right. \\ & 20 \times 3 = 60 \text{ { cups } } \\ & \left. \right] \end{aligned}$$

3. **Determine the amount of feed given in the final meal : **

- The total amount of feed needed for the day is 60 cups .

- The amount of feed given in the morning and afternoon is 40 cups .

- Therefore , the amount of feed given in the final meal is :

$$\begin{aligned} & \left[\right. \\ & 60 - 40 = 20 \text{ { cups } } \\ & \left. \right] \end{aligned}$$

<think>

- We calculated the total feed given in the morning and afternoon .

- We then found the total daily feed requirement for all chickens .

- Finally , we subtracted the morning and afternoon feed from the total daily requirement to find the final meal feed .

</think>

<answer>

20 cups

</answer>
