

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's break down the problem step by step .

1. **Identify the cost of each pair of glasses : **

- The cost of the first glass in a pair is \$ 5 .
- The cost of the second glass in a pair is 6 0 % of \$ 5 , which is $\$ 5 \times 0 . 6 0 = \$ 3 .$
- Therefore , the cost of one pair of glasses (one at \$ 5 and one at \$ 3) is $\$ 5 + \$ 3 = \$ 8 .$

2. **Determine the number of pairs in 1 6 glasses : **

- Since Kylar wants to buy 1 6 glasses , and every second glass is half price , he will have 8 pairs of glasses .
- This is because 1 6 glasses divided by 2 (one regular price and one discounted price per pair) is 8 pairs .

3. **Calculate the total cost : **

- Since each pair of glasses costs \$ 8 , and there are 8 pairs , the total cost is $\$ 8 \times 8 = \$ 6 4 .$

<think>

- Kylar buys glasses in pairs where the first glass is \$ 5 and the second glass is \$ 3 .
- This means each pair of glasses costs \$ 8 .
- Since Kylar buys 1 6 glasses , he will have 8 pairs .
- Therefore , the total cost is \$ 8 per pair times 8 pairs , which is \$ 6 4 .

</think>

<answer>\$ 6 4 </answer>
