

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Total feed per chicken per day = 3 cups
Total number of chickens = 20
Morning feed = 15 cups
Afternoon feed = 25 cups
Total feed required for the day = Total number of chickens * Total feed per chicken per day
Feed given in the morning and afternoon = Morning feed + Afternoon feed
Feed required in the final meal = Total feed required for the day - Feed given in the morning and afternoon
</think>
<answer>25</answer>
