

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To solve , first calculate the new value of the house after the repairs . An increase of 150% on the total cost (purchase price + repair cost) means we need to find 150% of that total and add it to the total . Then , subtract the total cost (purchase price + repair cost) from the new value to find the profit . Purchase price = \$80,000 , repair cost = \$50,000 , so total cost = \$80,000 + \$50,000 = \$130,000 . An increase of 150% on \$130,000 is $1.5 * \$130,000 = \$195,000$. So the new value of the house is $\$130,000 + \$195,000 = \$325,000$. Profit = new value - total cost = $\$325,000 - \$130,000 = \$195,000$. </think><answer>195000</answer>
