

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

`<think>` I am thinking about the possible causes of the patient's symptoms . The patient's complaints of missing her last 3 periods and intermittent spontaneous milky-white nipple discharge bilaterally are suggestive of hyperprolactinemia . Hyperprolactinemia can be caused by various factors , including pituitary adenomas , hypothalamic lesions , or other endocrine disorders . I am considering the possible laboratory results that would be expected in this patient . `</think><answer>` D . Increased prolactin , decreased FSH , decreased LH `</answer>`
