

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think> I need to analyze the symptoms presented by the patient to determine the most likely laboratory results. The patient's symptoms of missed periods and spontaneous milky-white nipple discharge bilaterally are indicative of hyperprolactinemia, which is often caused by a prolactin-secreting pituitary adenoma. This condition can disrupt the normal balance of hormones that regulate the menstrual cycle, leading to amenorrhea and galactorrhea. **</think><answer>** C. Increased prolactin, decreased FSH, increased LH **</answer>**
