

Question:

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the 'anatomical snuffbox'. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding?

Answer Choices:

- A. Radial artery
- B. Ulnar artery
- C. Princeps pollicis artery
- D. Brachial artery

Reasoning + Answer:

<think> The anatomical snuffbox is a region of the hand that includes the tendons of the thenar muscles and the radial artery. It is located on the thumb side of the wrist, between the metacarpal bones and the tendons of the thenar muscles. </think><answer>Radial artery</answer>
