

Question:

Shock causes:

Answer Choices:

- A. Stagnant hypoxia
- B. Anemic hypoxia
- C. Hypoxic hypoxia
- D. Histotoxic hypoxia

Reasoning + Answer:

<tool_call> reasoning process here

Shock is a condition characterized by inadequate blood flow to tissues , leading to impaired oxygen delivery . In shock , the primary issue is reduced perfusion of tissues due to decreased blood flow , which results in insufficient oxygen delivery to the tissues despite adequate oxygen content in the blood . This type of hypoxia is known as hypoxic hypoxia , where the tissue is not receiving enough oxygen because of poor blood flow , not because of reduced oxygen in the blood or impaired oxygen utilization .

Stagnant hypoxia occurs due to poor blood circulation and tissue congestion , but it is not the primary classification in shock . Anemic hypoxia results from decreased oxygen-carrying capacity of blood (e .g ., due to anemia), which is not the main mechanism in shock . Histotoxic hypoxia occurs when tissues cannot use oxygen (e .g ., due to cyanide poisoning), which is not typical in shock .

Therefore , the most appropriate classification of hypoxia in shock is hypoxic hypoxia .

< answer > Hypoxic hypoxia < /answer >
