

Question:

Reed sternberg cells are found in-

Answer Choices:

- A. Hodgkin's disease
- B. Sickle cell anaemia
- C. Thalassemia
- D. CML

Reasoning + Answer:

<tool_call> reasoning process here

Reed-Sternberg cells are large , abnormal cells that are characteristic of Hodgkin's lymphoma . These cells are found in the lymph nodes of patients with Hodgkin's disease and are a hallmark of the disease .

Sickle cell anaemia and thalassemia are blood disorders related to hemoglobin abnormalities and do not involve Reed-Sternberg cells .

CML (Chronic Myeloid Leukemia) is a myeloid malignancy characterized by the presence of the Philadelphia chromosome and involves myeloid cells , not Reed-Sternberg cells .

Therefore , the correct answer is Hodgkin's disease .

< answer >Hod g kin's disease </answer >
