

Question:

A 6 year old girl is easily distracted in class and exhibits poor scholastic performance. Seizures are precipitated by hyperventilation. What is the probable diagnosis?

Answer Choices:

- A. Myoclonic seizures
- B. Absence seizures
- C. Atonic seizures
- D. Myoclonia

Reasoning + Answer:

<think> The patient's symptoms include easy distraction , poor scholastic performance , and seizures precipitated by hyperventilation . These symptoms are characteristic of absence seizures , which are commonly associated with staring spells and can be triggered by hyperventilation . Myoclonic seizures involve sudden , brief muscle jerks , atonic seizures involve a sudden loss of muscle tone , and myoclonia is a form of jerking or twitching muscle movement . None of these conditions specifically match the described symptoms as closely as absence seizures do .

</think>

<answer>B. Absence seizures</answer>
