- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>

Schizo -a ffective disorder is a mental health condition that combines symptoms of schizophrenia and mood disorders , such as depression or mania . The key characteristic is that the mood symptoms occur before or simultaneously with the psychotic symptoms , rather than after the onset of psychosis . This is in contrast to other psychotic disorders , such as schizophrenia , which typically involve psychotic symptoms first .

The disorder can manifest in different ways , but the essential feature is the co - occurrence of psychotic symptoms and mood symptoms . The symptoms can be similar to those of schizophrenia and mood disorders , but the combination of the two is what defines the condition .

It is not a personality disorder , nor is it a subtype of either schizophrenia or affective disorders . It is a distinct condition that requires a comprehensive diagnosis by a mental health professional .

The correct answer is E , as it accurately describes the fundamental characteristic of schizo -a ffective disorder .
