

Question:

Which of the following factors is associated with a decreased risk of Alzheimer's?

Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>
The reasoning process involves considering the known risk factors and protective factors associated with Alzheimer's disease . Factors that increase the risk of Alzheimer's include older age , lower level of education , family history of Alzheimer's , smoking , and high intake of saturated fats . On the other hand , factors that are believed to decrease the risk of Alzheimer's include being married , having a higher level of education , and a healthy lifestyle that includes regular physical activity , a balanced diet , and social engagement . Eating fish is associated with a lower risk of Alzheimer's due to its high content of omega - 3 fatty acids , which have been shown to have neuroprotective effects . Therefore , the correct answer is the option that is associated with a lower risk of Alzheimer's .
</think>< answer> H . Eating fish </answer>
