

Question:

Calculate the quantity of heat required to (a) convert a liter of H₂O at 30°C to a liter of water at 60°C, and (b) heat a 1 kg block of aluminum from 30° to 60°C. Assume the specific heat of water and aluminum is, re-spectively, 1 cal/g°C and .215 cal/g°C.

Answer Choices:

- A. 28 Kcal, 6.3 Kcal
- B. 40 Kcal, 5 Kcal
- C. 30 Kcal, 8.58 Kcal
- D. 25 Kcal, 8 Kcal
- E. 29 Kcal, 7.77 Kcal
- F. 34 Kcal, 6.9 Kcal
- G. 30 Kcal, 6.45 Kcal
- H. 32 Kcal, 7 Kcal
- I. 35 Kcal, 7.5 Kcal
- J. 31 Kcal, 6.15 Kcal

Reasoning + Answer:

<think>
the specific heat of water is 1 cal/gÂ°C.
the specific heat of aluminum is 0.215 cal/gÂ°C.
the mass of 1 liter of water is approximately 1 kg.
the temperature change for water is 60 - 30 = 30Â°C.
the temperature change for aluminum is also 60 - 30 = 30Â°C.
the heat required to heat water is 1 kg * 1 cal/gÂ°C * 30Â°C = 30 Kcal.
the heat required to heat aluminum is 1 kg * 0.215 cal/gÂ°C * 30Â°C = 6.45 Kcal.
</think>< answer> G </answer>
