

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think> The infant's initial reaction to the mother's return , crying and taking time to settle down , suggests a level of distress upon separation and reunion , which is a characteristic of an anxious attachment . However , the infant eventually returns to playing happily with the mother , indicating a secure attachment . This behavior is consistent with an anxious-resistant attachment , where the infant is anxious about separation but also seeks comfort from the mother upon reunion . </think><answer> I </answer>
