

Question:

At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think> At birth , the brain is still developing , and different parts of the brain mature at different rates . The visual system is relatively mature at birth , as infants can detect light and dark , and can even focus their eyes . The thalamus , basal ganglia , and hypothalamus also show some level of maturity at birth . The limbic system , which is responsible for emotions , is also relatively developed . The parietal lobe , which is involved in processing sensory information , is also well-developed . The cortex , which is responsible for higher-order thinking , is still developing rapidly after birth . The cerebellum , which is involved in motor coordination , is also still developing . However , the frontal lobe , which is responsible for executive functions , decision-making , and planning , is the least developed part of the brain at birth . This is because the frontal lobe continues to develop and mature well into adolescence and even into early adulthood . Therefore , the least developed part of the brain at birth is the frontal lobe . </think><answer> C </answer>
