

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>
infant crying and continues to do so even after being picked up by the mother suggests the infant is not seeking comfort , which is typical of an insecure attachment classification . The fact that the infant eventually settles down and returns to playing with toys indicates the infant has some trust but is not overly secure .
</think>
<answer>
J. Secure
