

Question:

Which of the following would increase the capacitance of a parallel-plate capacitor?

Answer Choices:

- A. Decreasing the voltage between the plates
- B. Using a dielectric material that has a zero dielectric constant
- C. Using smaller plates
- D. Moving the plates closer together
- E. Moving the plates further apart
- F. Increasing the voltage between the plates
- G. Replacing the dielectric material between the plates with one that has a smaller dielectric constant
- H. Increasing the distance between the plates

Reasoning + Answer:

<think>
<answer> F </answer>
</think>
