

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>

- The infant initially cries when the mother leaves and continues to cry even when she returns .
- The infant does not seek much comfort from the mother upon her return .
- The infant eventually settles and plays happily .
- This behavior is indicative of an infant who is not overly dependent on the mother for comfort and settles down on their own .

This pattern is characteristic of an avoid ant attachment style .
