

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>
- Anxious - Resistant infants show distress when the caregiver leaves and then continue to show distress when the caregiver returns , even if the caregiver tries to comfort them .
- The scenario describes the infant being distressed when the mother leaves , continues to cry when she returns , and only settles down after being picked up .
- This behavior matches the description of an Anxious - Resistant attachment .

</think>
<answer>
I. Anxious resistant
</answer>
