

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>

- Anxious avoidant: The infant shows distress when the mother leaves and shows little distress when the mother returns .
- Disorganized : The infant shows confused or disoriented behavior .
- Ambivalent : The infant shows distress when the mother leaves and the mother returns .
- Fearful avoidant : The infant shows distress when the mother leaves and shows little interest when the mother returns .
- Avoidant : The infant shows distress when the mother leaves but shows little interest when the mother returns .

The infant in the scenario shows distress when the mother leaves the room but continues to cry even after the mother returns and picks them up , and eventually settles down and plays with toys . This behavior is indicative of an infant who is distressed by the mother's departure and then shows little interest upon her return , which aligns with the characteristics of an avoidant attachment .
