

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>

- The infant's reaction to the mother's departure and return is a key indicator of attachment classification .
- The infant initially cries when the mother leaves and continues to cry even when the mother returns , indicating distress .
- The infant eventually settles down and returns to playing , which suggests a degree of comfort with the mother after the initial distress .
- This pattern is characteristic of the anxious-resistant attachment style , where the child is highly distressed by the parent's departure and ambivalent towards the parent upon return .

Answer> I. Anxious resistant
