

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think> The infant's behavior suggests that they were distressed when the mother left and showed a strong need for the mother's presence . However , upon the mother's return , the infant did not seek much comfort and instead continued to cry . This is a hallmark of an anxious-resistant attachment , where the child is wary and ambivalent about the caregiver's departure and return .

Answer Choices :

- A . Anxious avoid ant
- B . Dis organized
- C . Dis oriented
- D . Amb ivalent
- E . Dep endent
- F . Attachment disorder
- G . Fearful avoid ant
- H . Avoid ant
- I . Anxious resistant
- J . Secure

The infant's behavior aligns most closely with the anxious-resistant classification .

</think>< answer > Anxious resistant </answer>
