

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think> The behavior described suggests that the infant is not distressed when the mother leaves and is happy to return to playing . This indicates that the infant does not show a strong need for the mother's presence or comfort , which is a characteristic of avoid ant attachment . </think>
<answer> H . Avoid ant </answer>
