

Question:

Lisa is part of a choir that has 52 members, 50% of which are boys and 50% of which are girls. The choir decides to perform with just its female members. On the day of the performance, however, half the people performing can't make it to the show because their bus breaks down. The choir's 3 teachers then decide to sing with them. How many people sang in the performance?

Reasoning + Answer:

<think>
There are 50 % of 52 members which is $0.5 * 52 = 26$ members who are girls .
This means there are 26 people performing to begin with .
Half of the performing people can't make it to the show , so that is $26 / 2 = 13$ people who can't perform .
13 people not performing plus 26 people performing means $26 - 13 = 13$ people in total ended up performing .
Adding the 3 teachers brings the total to $13 + 3 = 16$ people .
So , 16 people sang in the performance .
</think>
< answer >
16
</answer>
